Department of the Navy (DoN) Application and Database Management System
(DADMS) ID Information

What is a DADMS number and why does it need to be provided? DADMS is a web-enabled registry of Navy and Marine Corps systems and applications. It is the authoritative source for DoN Information Technology (IT) applications. Per OPNAV N6122, if an application or system is not registered in DADMS, it is not considered an official Navy application or system and therefore cannot be allowed to go onboard a Navy ship.

Know that a new DADMS ID number is required for
- Every application to be considered for inclusion on the NIAPS server
- Each different version of an application (no matter how minor the version change).
    > **Example:** Application XYZ version 1.0 is registered in DADMS. The application has been upgraded to version 1.1. Because the version number changed, a new DADMS number is now required.

- Applications whose name has changed
    > **Example:** Application XYZ version 1.1 is registered in DADMS. A decision to change the name of application XYZ from "XYZ version 1.1" to "ABC version 1.1" has been made. Even though the functionality and version number remained the same, the name change requires a new DADMS number assignment.

Instructions for this deliverable:

If application already has a DADMS number:
1. Indicate the DADMS ID number and Functional Area on the NIAPS Request in Serena Dimensions.

If application does not have a DADMS number:
1. Obtain one by visiting the DADMS website at https://www.dadms.navy.mil or by calling the DADMS Help Desk at DADMS@att.com or by calling (703) 506-5220.
2. When a DADMS number has been obtained, indicate it and the Functional Area on the NIAPS Request in Serena Dimensions.

The "Functional Area" for an application can be found within the application's DADMS record.

Note:

1. Supplying a DADMS ID number is mandatory. An application will not be approved for inclusion on the Navy Information Application Product Suite (NIAPS) without it first having a DADMS ID number.

2. The Functional Area Manager (FAM) makes the final determination of the need of a new DADMS ID for software version changes. If the FAM, for your application, makes a determination that a new version of your product does not need a new DADMS ID you must repose (upload) a copy of an email or some other correspondence in Serena Dimensions indicating that fact. That correspondence should specifically state: "(application name) version number _____ does not require a new DADMS ID. The current DADMS ID of _____ is acceptable for the current version of (application name)." Provide the name, title, email address, and phone number of the FAM.
